The reading process in one page

PRINTABLE SUMMARY / PRIVATE EDITORIAL PROOF

Write a precise question: people, condition and stage, exact drug/formulation/route, comparator, outcome and follow-up. Keep a prevention question separate from a treatment question.

Trace the claim

Save the original link, then find the report behind it. Record title, stable identifier, date and whether you read the full text, abstract or registry. Label discussion sources as discussions.

Preserve the result

Copy the estimate with its units, denominator, uncertainty and timepoint. Record the exact page/table/section. Keep the observed result, authors' conclusion and your interpretation separate.

Attach the limits

Note the most important applicability mismatch, design limitation, missing outcome or inaccessible source. Keep benefit and harms on separate lines. "Not checked" and "not reported" are different entries.

Ask a useful question

Bring one relevant source and one specific uncertainty to a qualified professional. Complete the separate claim worksheet. No part of this process tells you to start, stop or change a medicine.

Check yourself: Can you state the population, comparison and outcome? Can you find the supporting result? Can you name one conclusion the report does not establish? If a step is missing, return to it.

Original workflow summary of the Second Look Evidence Reading Guide, edition 0.1, 8 October 2026. Full supporting context sources appear in the guide. Human editorial and independent qualified review pending; reader testing not performed.
